ELOKA - Mission Statement

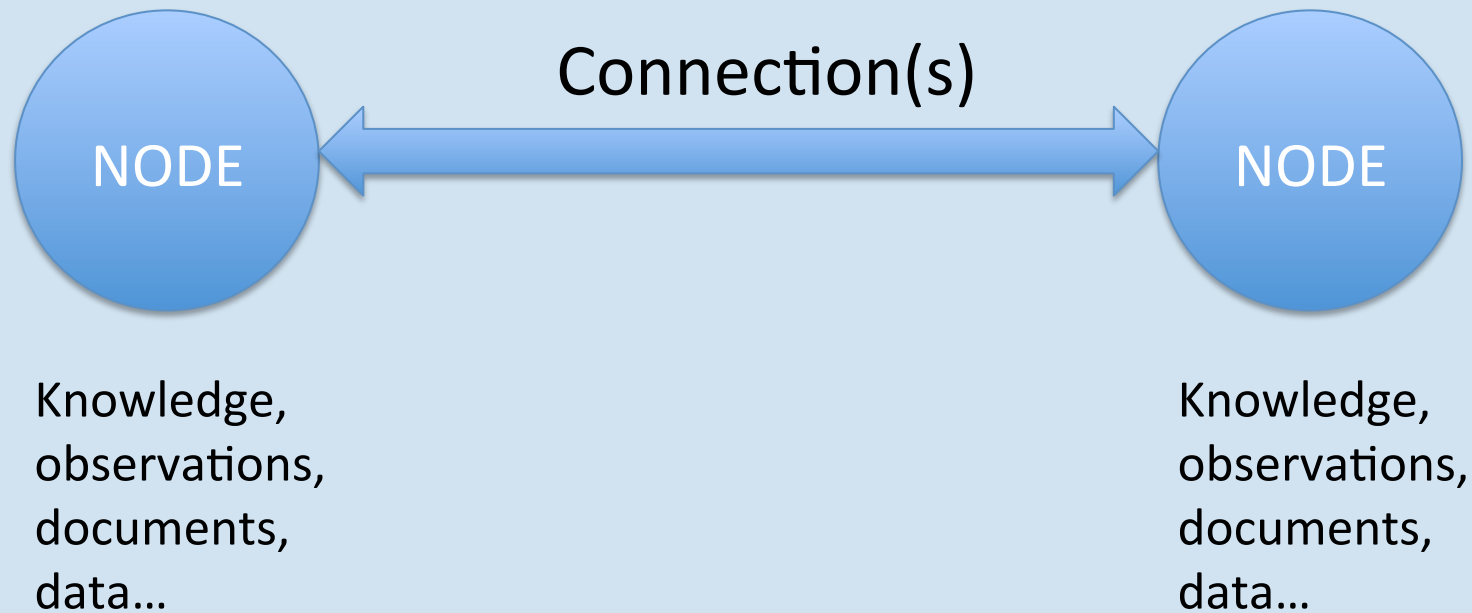

To provide data management and user support services to facilitate the collection, preservation, exchange, and use of local observations and knowledge of the Arctic.

Interoperability

- Interoperability: *Property of a product or system, whose **interfaces** are completely **understood**, to work with other products or systems, present or future, without any restricted access or implementation.*
- *Task of building **coherent services** for users when the individual components are technically different and managed by different organizations (Wikipedia)*
- Semantic interoperability: *the ability to effectively **exchange meaning** between information systems*

Interoperability

Atlas of Community-Based Monitoring in a Changing Arctic (Arctic CBM)

This atlas showcases Arctic communities actively involved in observing social and environmental change. It was designed to highlight the many community-based monitoring (CBM) and traditional knowledge (TK) initiatives across the circumpolar region.

Topics Environmental, ecological, and cultural changes and observations

Geographic areas Circumpolar region

Date range Ongoing

Local Observations from the Seasonal Ice Zone Observing Network (SIZONet)

This data set contains observations of sea ice, weather, and wildlife collected by Indigenous Inupiat and Yup'ik sea ice experts in several communities along the northern and western coasts of Alaska, beginning in 2006.

Topics Sea Ice Snow Weather Wildlife

Geographic areas Alaska, United States

Date range 2006 to Present

Data Set Citation

Dataset Creator: Miriam Fleming
Dataset Title: Sea Ice Observations in the Belcher Islands, Nunavut, Canada
Dataset Release Date: 2010-04-01
Dataset Release Place: Boulder, Colorado USA
Dataset Publisher: National Snow and Ice Data Center (NSIDC)
Data Presentation Form: Digital Media

Lucassie Takatak: Sea ice observations

Lucassie Takatak has spent decades traveling on the ice around the Bechar Islands, hunting for the Saarikilaag community and teaching young hunters. Hunters have long relied on stable sea ice conditions to reach seals, geese, ducks, and whales. But sea ice extent and thickness have changed recently, causing Lucassie and other hunters to find new hunting routes to avoid dangerous ice.

Cornelius Nutarak Interview

Nutarak: We as Inuit cannot say how fast they go, we just know by hunting them that they can be pretty fast, we cannot tell you like how fast they go with western numerical systems, but I can say that when you hunt them they can go pretty fast like if you are watching them being hunted, they can be swift in their attempts to get away from the hunters. When they do that we say unguukaalungmata, when they swim away.

Lucassie Takatak: Sea ice observations

Lucassie Takatak has spent decades traveling on the ice around the Belcher Islands, hunting for the Sanikiluaq community and teaching young hunters. Hunters have long relied on stable sea ice conditions to reach seals, geese, ducks, and whales. But sea ice extent and thickness have changed recently, causing Lucassie and other hunters to find new hunting routes to avoid dangerous ice.

Snowchange Oral History: Nutendli Chukchi Obshchina

English | Pyccar

The Nutendli Chukchi obshchina has reindeer herding areas on the Eastern bank of the Kolyma river. The Nutendli community formed when they split from the Turvaargin community in 1989, and the process was completed in the early 1990s. In 1992, 1,107 reindeer were given to Nutendli from the sovkhos, or the state-owned farm, to start their herd. Today over 2,000 reindeer form the economic base of the community.

Section of map of Nutendli community land use. View a full version of the map. Credit: © Tero Mustonen, Snowchange Cooperative / caption]

The community is led by Vyacheslav Kemilil, son of Grandmother Akulina Kemilil and Grandfather Jegor Nutendli, the Elders of the community. Other relatives such as Zoja Nikolajevna Tokareva, sister of Akulina, belong to the community.

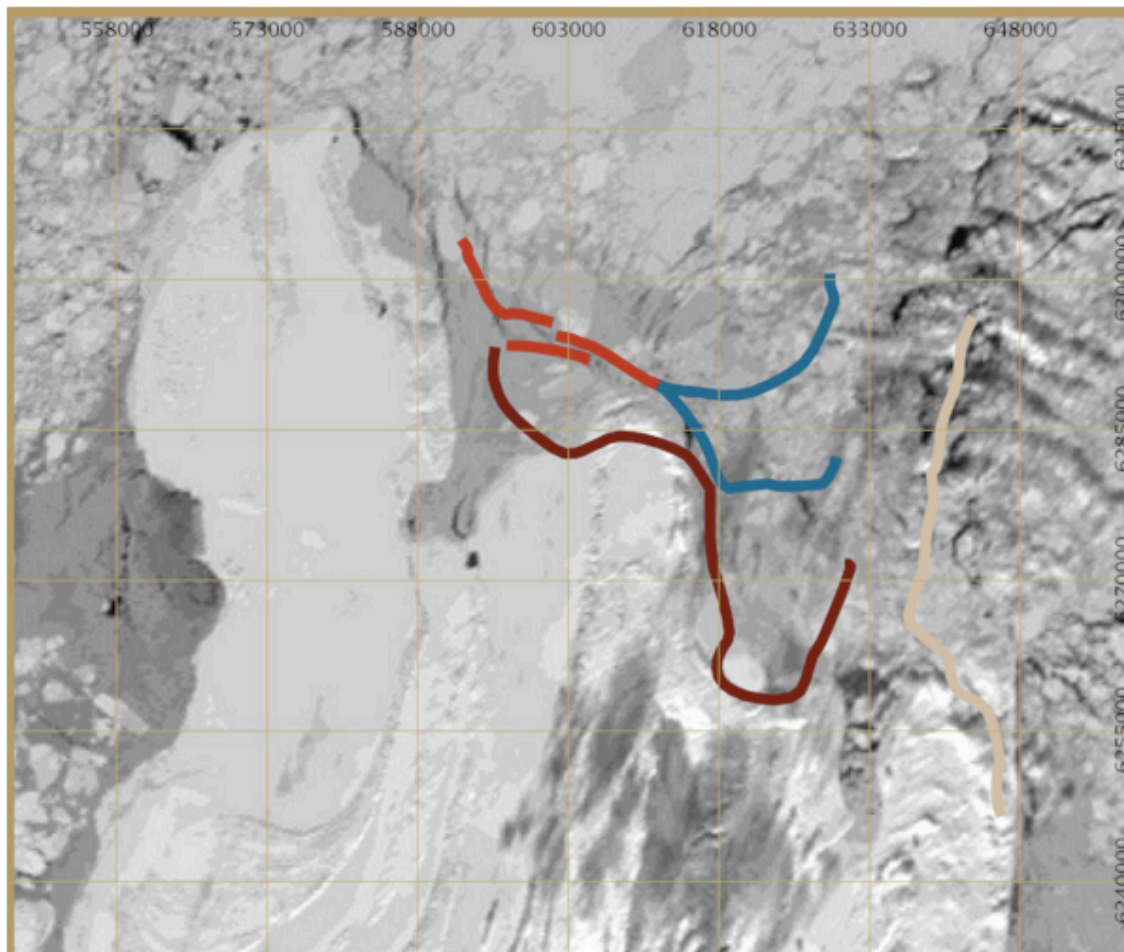

From 2005 to 2008, Nutendli had one brigade with three yaranga. The first brigade is led by Vitaly Kemilil, brother of Vyacheslav. By 2010, a second reindeer herding brigade had been established. In addition to herding, subsistence fishing and some hunting form the basis of Nutendli livelihoods. The Nutendli reindeer belong to the khargin breed, which is a stock of reindeer with a special national status.

The work that Nutendli has undertaken with the Snowchange Cooperative follows the same lines as with Turvaargin. One of the exceptions is the nomadic school that Nutendli established in 2002. Several donor organizations, such as the United Nations Educational, Scientific and Cultural Organization (UNESCO), Save the Children Iceland, the Snowchange Cooperative, and others have worked to support the school over the years because it is a unique

INTEROPERABILITY: HUMAN INTERFACES AND CONNECTIONS

Individuals as Interface

Collective Statement

Indigenous Knowledge: Key Considerations for Polar Data Planning

Statement from the *Sharing Knowledge: Traditions, Technologies, and Taking Control of our Future Workshop* held 22-24 September 2015, Boulder, Colorado
Organized by the Exchange for Local Observations and Knowledge of the Arctic (ELOKA)

Indigenous peoples are increasingly leading and contributing to science and research activities across the Arctic. Indigenous knowledge is being documented in myriad ways in these activities and there is a need for this knowledge to be preserved, managed, and shared along side other data.

Indigenous knowledge is not western scientific knowledge and we should not try to make it so. We must recognize and embrace the differences and avoid the singular dominance of “hard data” or “hard science”. We must be aware and careful of privileged perspectives in Arctic research and data management.

Working with Indigenous knowledge requires understanding the context of the knowledge and the context of Indigenous peoples in the Arctic. For example, Indigenous languages must be respected and supported. Language is more than a means of communicating, but a way of thinking. It is also deeply connected to (among others) observing, knowing, and skill. Also, Indigenous peoples should not be viewed as a group of “stakeholders” in the Arctic. The Arctic is a homeland to Indigenous peoples and there are critical issues related to the assertion of rights, sovereignty, security, and self-determination. These contexts must be considered when working with Indigenous data.

There is a need for distributed systems. Indigenous knowledge is geographically and culturally specific and information systems should reflect this. We need to avoid aiming to establish a centralized system but rather focus on meeting the needs of individual communities and on interoperability between systems.

Indigenous communities in the Arctic are the providers of information, users of information, monitors of information, and decision-makers. The uses of data technology are changing rapidly in these communities. We need to continue to work to put control of technology in local hands and invest in improving bandwidth, access to technologies, training and capacity building.

Establishing protocols for proper consent related to data collection and use, and for data management for Indigenous knowledge is critically important and urgent. There is a need for research and data management planning to be driven by Indigenous peoples, communities, families, and organizations. There is a need for infrastructure and resources so this can be realized.

Protocols are needed for documenting and using Indigenous knowledge in a digital form, however, these must be reflexive and consider cultural, historical, and geographical contexts rather than focusing on technical aspects of standards. Adaptability is key.
